

Phontage.....

Ericsson-LG Enterprise systems Softphone console.

Whether you're traveling across the globe or just in the next room, carrying on a conversation doesn't have to mean carrying extra equipment. By programming your office iPECS system and then simply installing Ericsson-LG Enterprise's Phontage Softphone and you can turn any PC or laptop into a replica of your desk telephone.

Phontage Softphone is a screen-based interface that works just like your telephone keypad. You can make a call, receive a call, and pick up your voicemails too. And because it becomes a part of the office iPECS or Aria-ipe system, you get the extras that you've come to expect, like Caller ID with Name, Call Forwarding, and more

Advanced Features Too

Your Phontage Softphone works seamlessly with your office iPECS system features. For example, you can access and use system features such as dialing other stations, setting call-back, receive paging announcements, access voicemail or park calls – all from a location across the country or across the globe!

Ericsson-LG Enterprise systems Softphone console.

Easily Setup and Intuitive to Use

Remember that your Ericsson-LG Phontage works as an extension from your office iPECS system, and requires a DSL link or hotspot to operate. Once set up the operation is simple. The dialing interface looks just like the picture above. Simply point and click to speak through your computer. We recommend that you use a quality headset with a microphone rather than relying on the audio input/output devices that come standard with your computing equipment.

Features

- iPECS system integral and dependant
- Full system functions
